MISUNDERSTANDINGS OF SOCIAL PHOBIA

Poster / Exhibition / UI Design

BACKGROUND

I have suffered SAD (Social Anxiety Disorder). What the social interaction brings me is not happiness but the tons of burden. Actually I am eager to receive love via communication, but once the communication kicks off, I cannot help but keep my eyes off others and try to find a proper pose without any specific expression. I have no way to give vent to my pain and I am clear that my fear in social interaction will not bring the anxiety away, but make it worse in others' eyes.

BACKGROUND

SAD is a long-term and overwhelming fear in social occasions. People with serious social anxiety tend to avoid sight, show less facial expression and have difficulty in opening and maintaining a conversation. Unlike those introverts, most of people suffering from SAD cannot enjoy the fun of solitude, but are extremely eager to communicate with others and have intimate relationships. Such sharp contrast increases the weight of inner pain.

REASONS

Genetic | Negative experiences | Characteristics

INFLUENCES

The simple daily activities may directly influence the work,relationships, and almost any other situation SAD people are involved in.

DESIGN STATEMENT

Through the analysis of social phobia andmy own feelings, this project hopes to present the state of social phobia in visual conversion, so that people can understand it from another perspective.

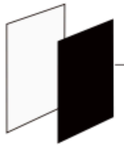

INFLUENCES

- SAD people will show some unnatural behaviors with other people in communication, and have very different descriptions of their behaviors from others do.

PRESENTATION

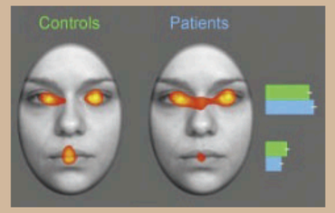

The two groups of people have different views on social interaction.

- TWO VIEWS

It presents the perspective of two people in communication and expresses two different emotional views. By doing so, I want to show some misunderstandings between SAD people and other people.

SOCIAL PHOBIA &EYE CONTACT

It studies the eye tracking patterns of SAD patients and controllers in facial emotion recognition task, and the studies about eye tracking and computerized facial expressions have shown that SAD patients have less time in eye fixation and retention.

This study also determines the eye area of SAD patients, which is conducive to studying and determining specific emotions compared with other senses.

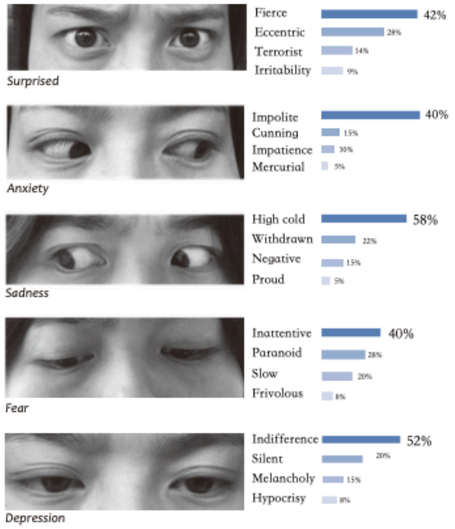

IDEATION

The above experimental analysis focuses on the relationship between social anxiety disorder and the attention to the eye area. Therefore, I would like to use the flustered eye movements as graphics to express the state of SAD patients in communication, and describe their inner emotions with my own experience and research.

QUESTIONNAIRE SURVEY

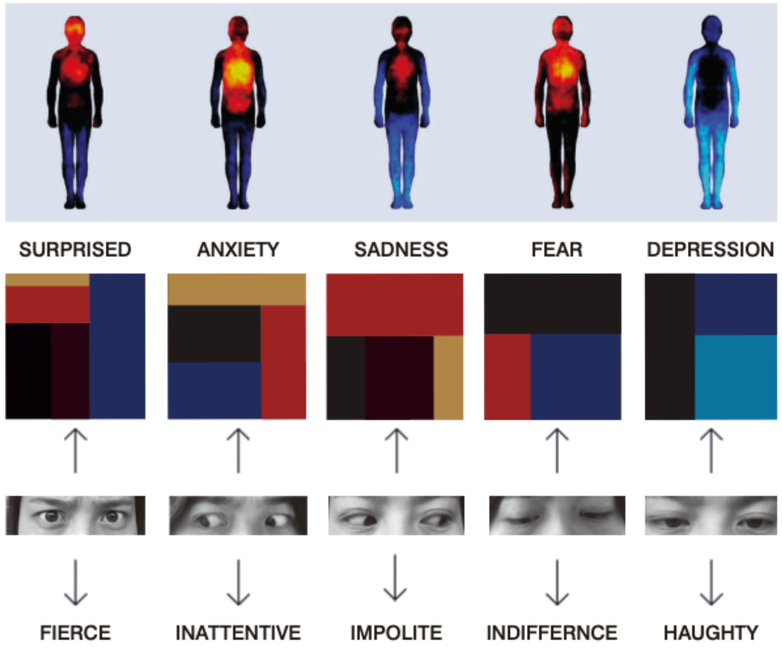

I abstracted five expressions in eyes of SAD patients in normal communication, let them describe their emotions accordingly, and collected other people's views through questionnaire survey.

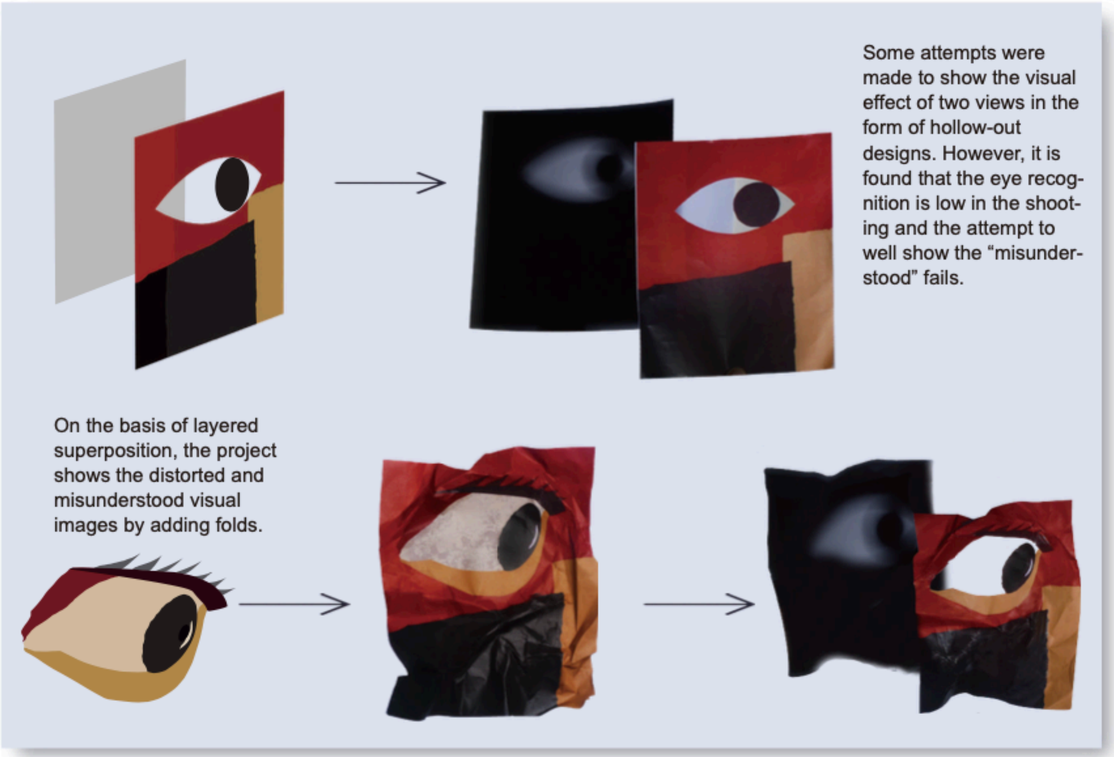

The research leads to the conclusion that the public has negative evaluation on most of these behaviors. Therefore, I tried to match these two opinions.

CORRESPONDING RELATION

The study, conducted by Finnish researchers, aimed to explore whether discrete emotional states are related to unique patterns of physical sensation. According to the research below, emotions and colors are mapped one by one, and colors are drawn according to the color scale of the emotion map.

DESIGN PROCESS

Some attempts were made to show the visual effect of two views in the form of hollow-out designs. However, it is found that the eye recognition is low in the shooting and the attempt to well show the "misunderstood" fails.

On the basis of layered superposition, the project shows the distorted and misunderstood visual images by adding folds.

VISUAL DESIGN

FINAL WORK

Details

In this way, it finally presents the perspective of social phobia and human communication

GRAPHIC TRANSFORMATION

FINAL WORK

By scanning the QR code, people can gain a good knowledge about SAD, and SAD patients can write down their own inner story on interface, which reflects my own state of mind. I hope to harvest love and friendship, and people can make friends with me. Let us solve those misunderstandings, and become friends!
